Boston

Kailash Swarna, Ph.D., MBA

A defining moment for biopharma: working in human+machine mode

We work and live within interlinked realities: physical and digital. The interconnection grows more pervasive as technology and science thrive – creating new, radical possibilities across the biopharma value chain. Working in human+machine mode, industry innovation is surging. Scientists, patients, healthcare professionals (HCPs) and business leaders are driving it, powered by four technology trends.

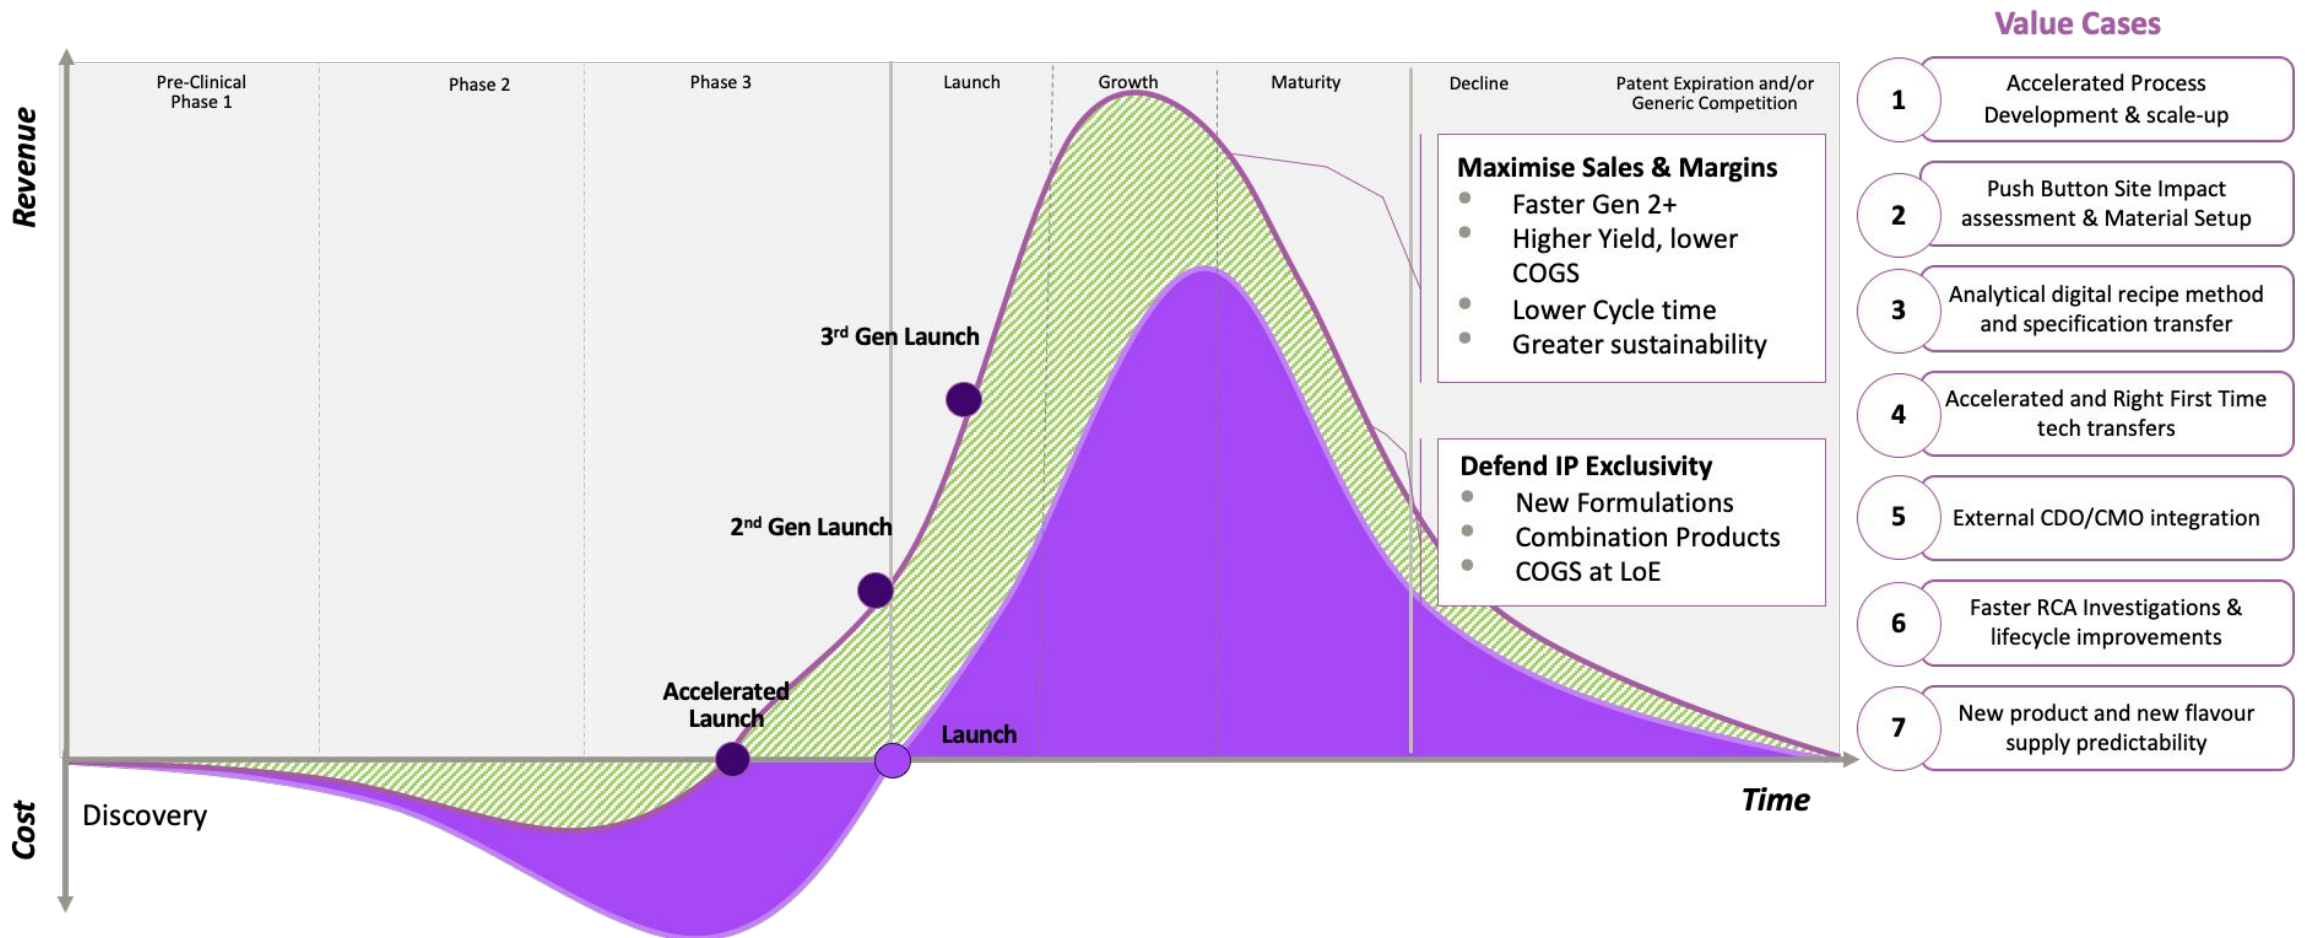

In **Accenture's Technology Vision 2023 for Biopharma**, we explore how these four trends – *Our forever frontier*, *Generalizing AI*, *Your data, my data, our data* and *Digital identity* – are guiding different ways of working, operating, innovating, collaborating and growing.

We believe the time has come to further blur the lines and welcome the next wave of innovation and business transformation in biopharma.

Evolving macro-economic factors and the demand for greater and faster access to innovative medicines will drive change

AI-Driven Performance Frontier

Move beyond today's standard to a new model of value creation. BioPharma companies must reexamine how they define and generate value and form a system that benefits all stakeholders in the value chain. They must rapidly test new and emerging technologies to fuel continuous

Create sustainable value

Sustainable value creation

Setting, measuring, and achieving balanced goals on equitable, sustainable outcomes

Applied Tech-Enabled Innovation

Persistent scanning, incubation, and acquisition of outside-in digital technology innovation

AI-led discovery

Rapid identification of targets that have a lower risk of failing during development and predictive modeling for lead identification & optimization

Lean, fast development

Future of development is established, with the use of new clinical trial methods (e.g., DCT, synthetic control arms), which dramatically reduce cycle times and improve efficiency

Power your people

Accelerate growth

Dynamic portfolio management

Dynamic management of TAs, bio-platforms, modalities, technologies, and devices with their RWE, economics & pricing implications considered

Connected scientific innovation ecosystem

Diverse array of scientific partnership approaches that are modular and flexible; attract an array of partners in the pre-competitive space; leverage data, capabilities, and talent

Thriving organizations

New workforce models; empowered employees through role structure and technology; intrapreneurial mindset

Deliver value & optimize operations

Connected supply chain, manufacturing & quality

New Science necessitates transformation to more automated and digitized manufacturing and supply chain networks

Full value chain business planning

E2E visibility and predictability across value chain; win-win data partnerships; cross-functional planning

Modern Leaders

Progressive and purpose-driven culture; iconic leadership representative of workforce; risk-intelligence; data and tech fluency

Modernized commercial model

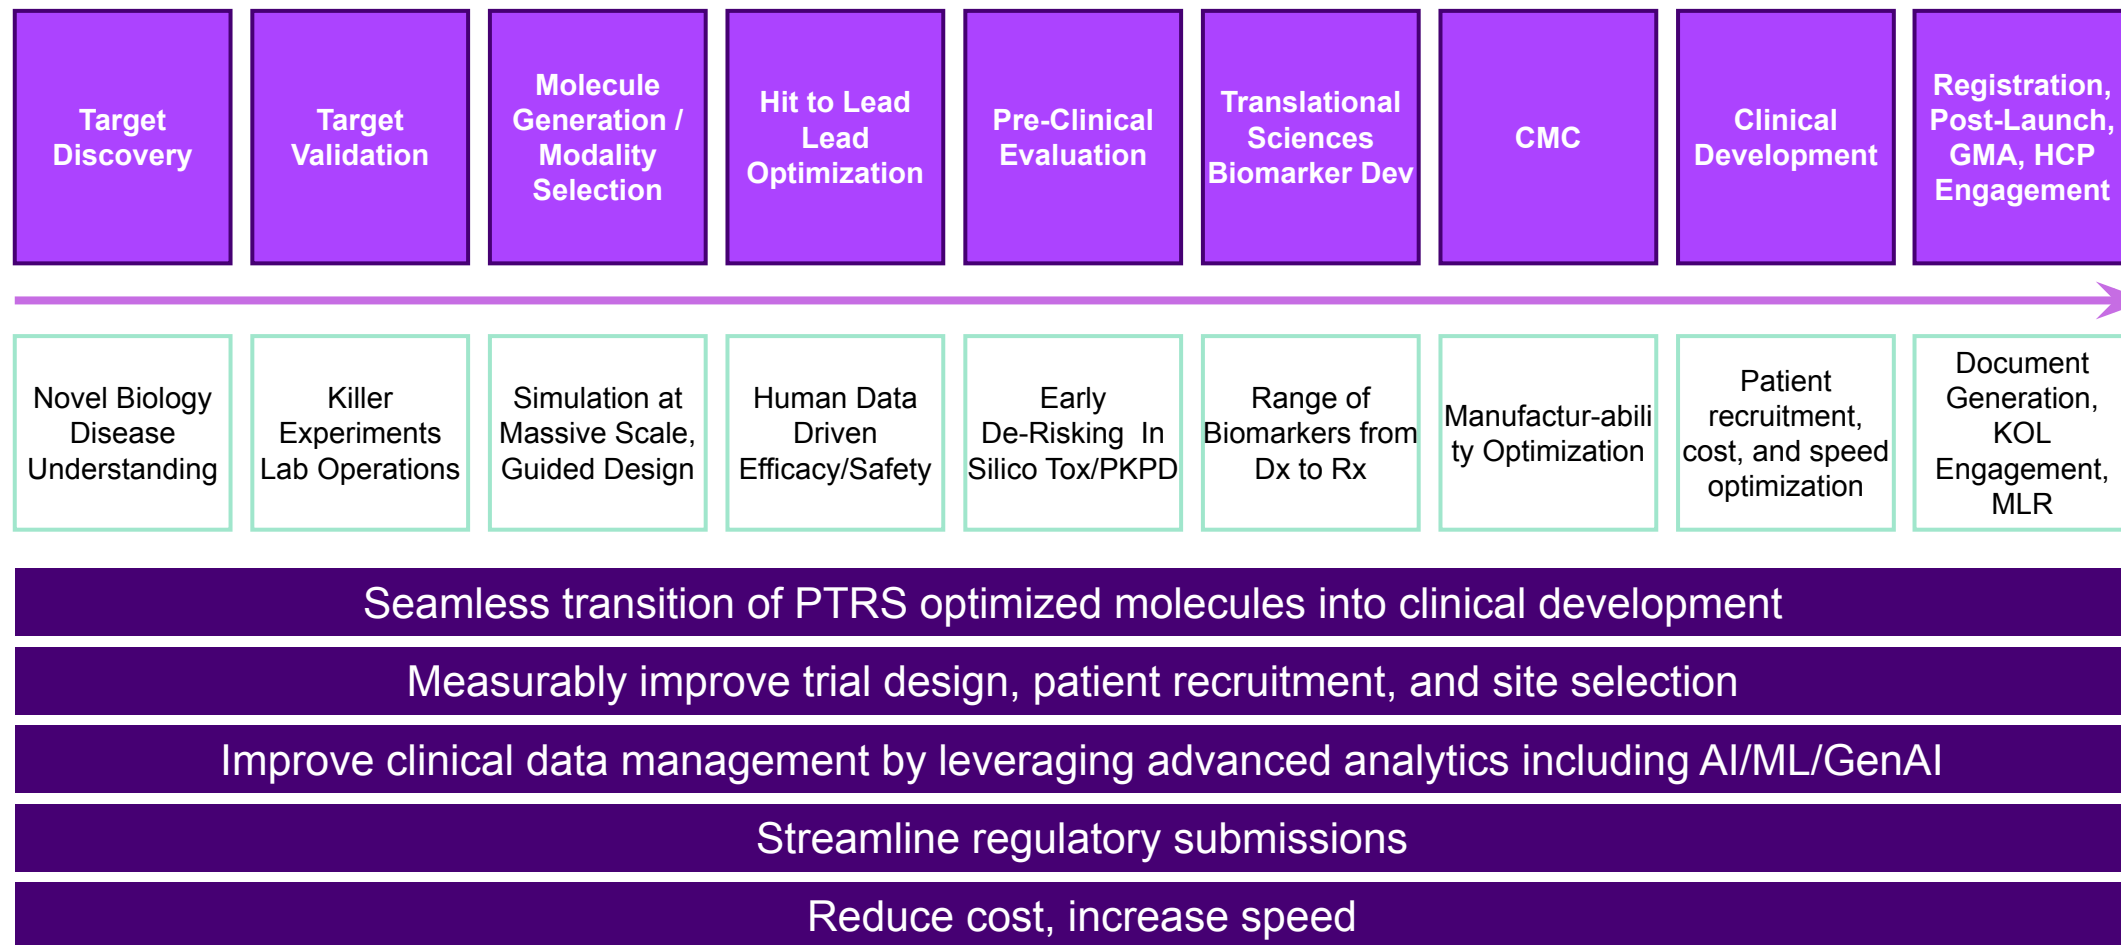

ROI from data & analytics investments, innovative pricing & access models and launch capabilities, E2E marketing, omni-channel engagement and patient-centric experience design

Digitization and optimization of enabling functions

Evolution of the Enabling Functions (HR, IT, Proc, Fin) to accelerate business performance and harvest OpEx savings enabled by digitized and intelligent processes designed to deliver a simplified experience

Digital core

AI/ML/GenAI has the potential to fundamentally transform R&D

Market provocations are met with new capabilities and enablement from a strong digital core

Life Science Provocation..

Discovery

Startups outperform incumbents by championing AI-led discovery with multi-disciplinary computational and scientific teams to reduce cycle times and discovery cost

Clinical Development

New R&D approaches leverage digitally powered and patient-centric design, using data, advanced analytics and technology.

Requires these Primary NPF Capabilities...

AI-led discovery

Lean, fast development

Applied tech-enabled innovation

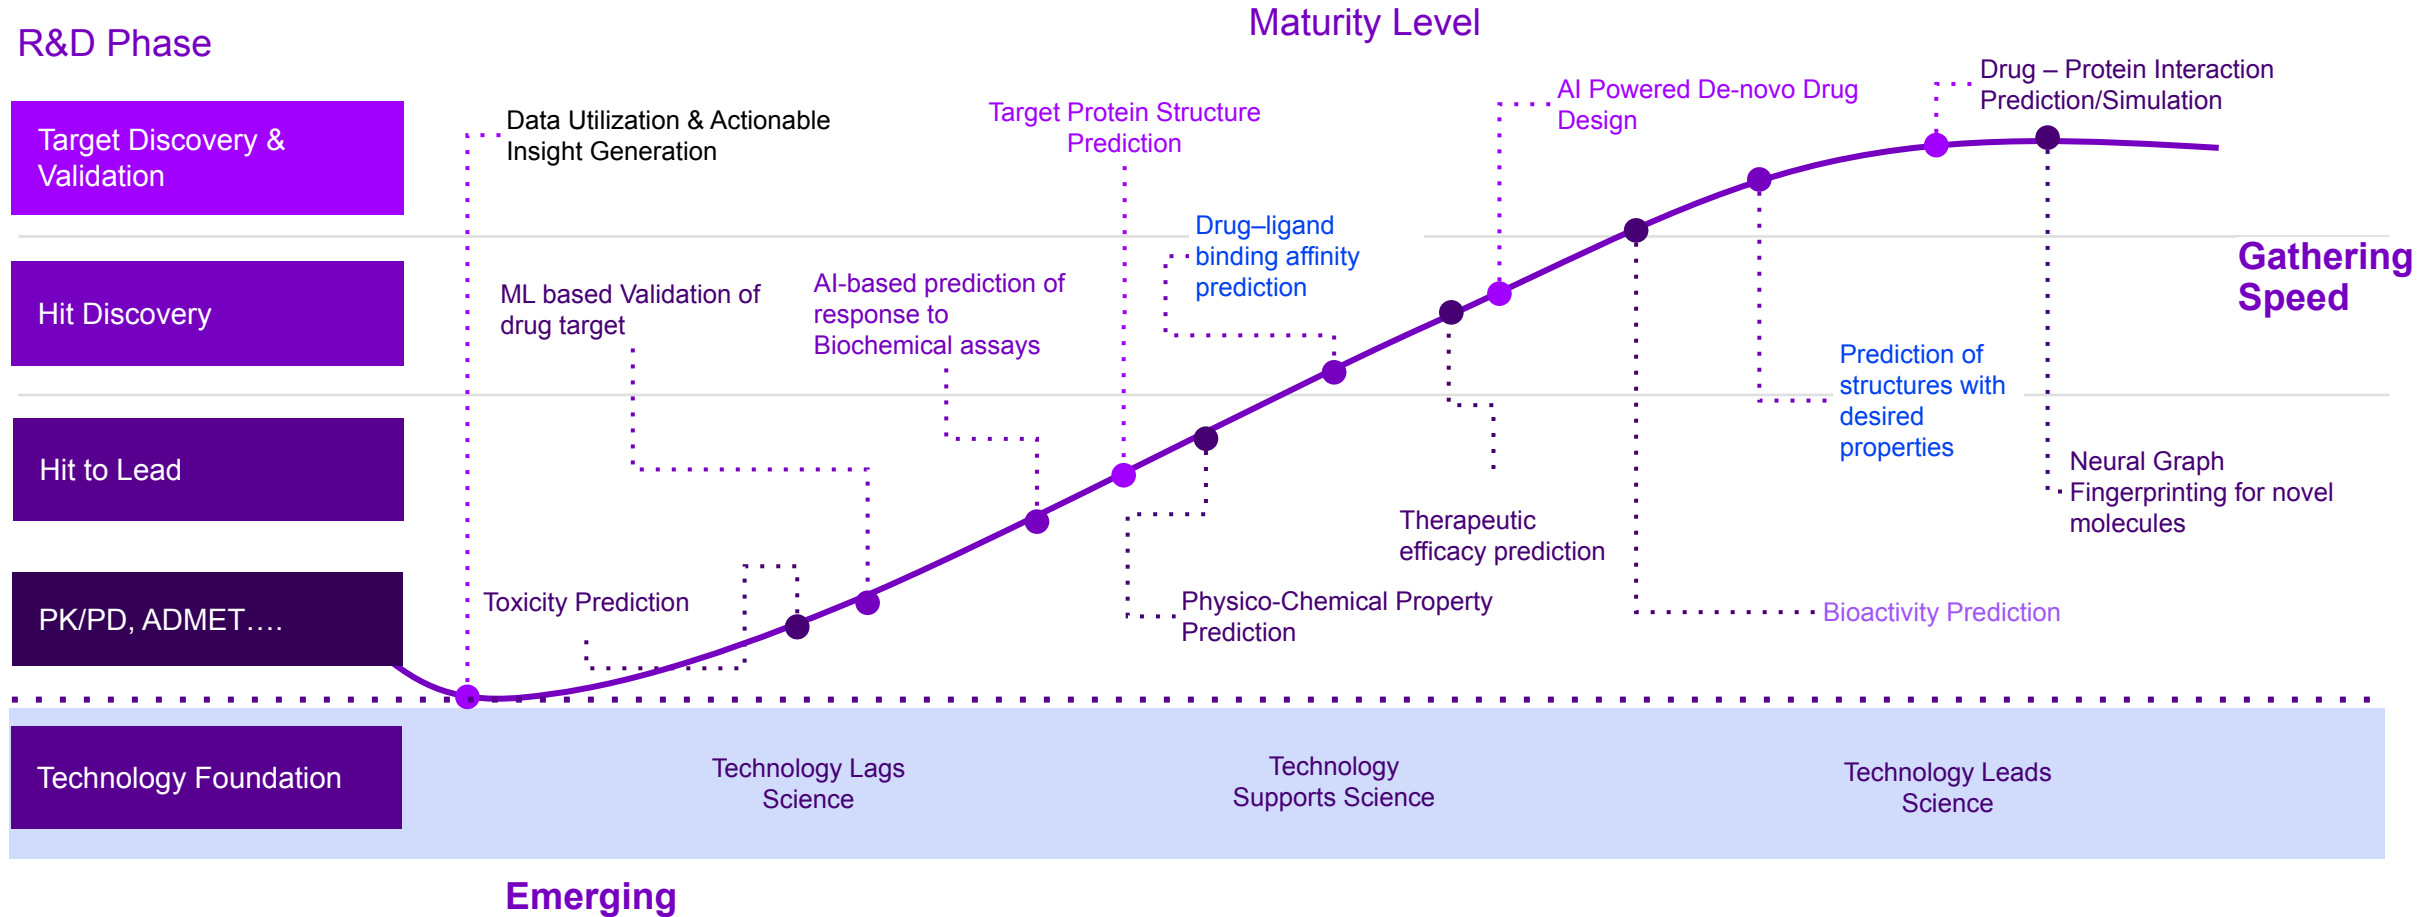

Connected scientific innovation ecosystem

Are enabled by these digital core capabilities...

- **Multidisciplinary** computational and experimental teams
- Scaled R&D portfolio via **AI-led discovery using platforms** which are embedded in the scientific operating model
- **Adaptive strategy** to identify priority opportunities, launch and scale market-changing products for resilient growth
- Scaled **AI to simplify and accelerate clinical development**
- **Integrated data, analytics and AI/ML** help profile and define patient populations to predict response to treatment at earlier trial stages
- **Data and experience-driven clinical trials** that accelerate time to market
- **Entrepreneurial approach** within the ecosystem to experiment and build new capabilities
- **Integrate** multiple **digital platforms** across different players to enable more robust, integrated stakeholder connections

Data, advanced analytics, and AI/ML/GenAI are changing drug discovery...

Illustrative

Focus Area

Digital First – from trial design to submission

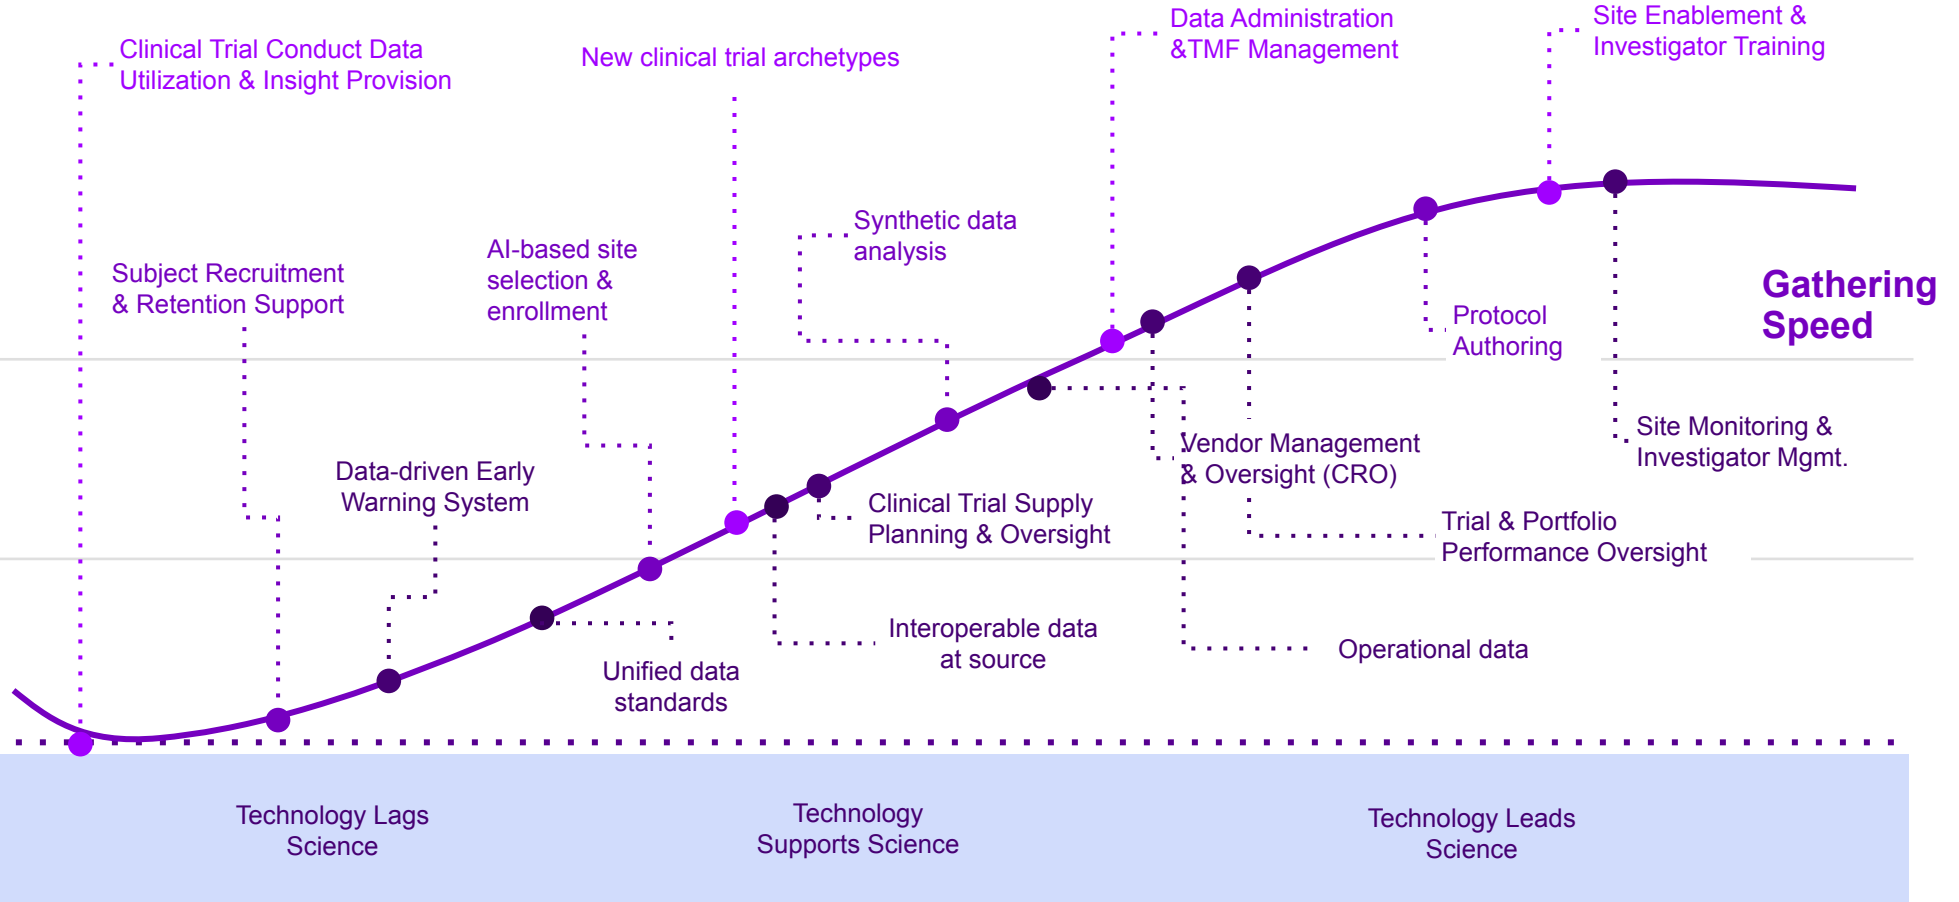

Analytics & Data Science, AI/ML/DL

Systemic risk reduction

Interoperable data

Technology Foundation

Maturity Level

Emerging

Generative AI is the next step in the evolution of AI/ML/DL

Machine Learning

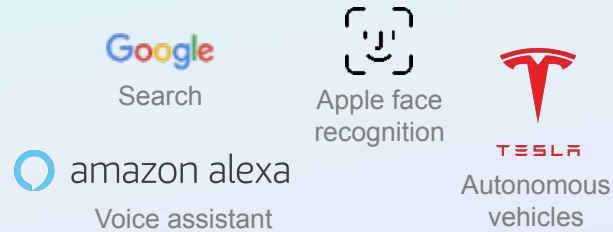

Learn to learn

- Decision trees
- Logistic/Linear regression
- Clustering
- Classification

Deep Learning

a type of machine learning

Mastery of perceptual data

- Image, object recognition
- Speech and facial recognition
- Fraud detection
- Reinforcement learning
- Neural network

Generative AI

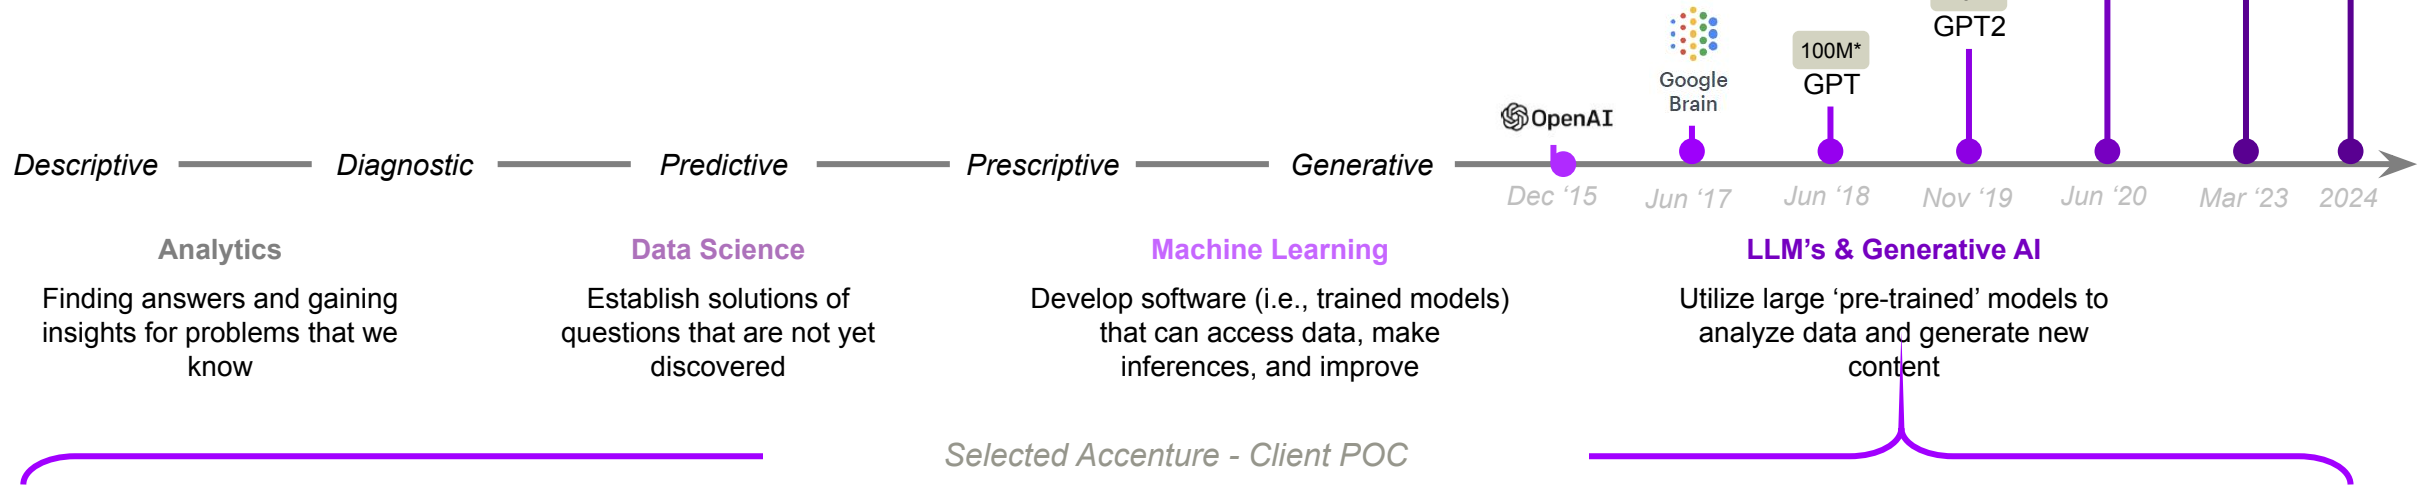

a type of deep learning using
Large Language Models and
foundation models

“Everywhere” Education,
business, arts, history, personal,
and creative

Learn once and adapt in many ways

- **Language mastery** across context, sentiment, emotion, grammar, syntax, etc.
- AI takes a more **autonomous** role to generate actions or content

GenAI continues to evolve at an astonishing pace – problems in drug discovery and development are now readily accessible

Driving value for Life Sciences companies

The future of biopharma reimaged with GenAI means identifying better candidates, bringing products to market faster (with higher quality), and maximizing sales and customer experience. A GenAI-infused biopharma also enables greater equity and sustainability.

Clinical Trials are poised to become digitally native

Impact of AI/ML/GenAI in clinical development

Area of Application	Technology	Benefit
Patient recruitment and identification	AI, ML, NLP	Streamlines patient identification by analyzing EHRs and databases for eligibility criteria
Protocol design and optimization	AI, NLP	Analyzes historical data, literature, and real-world evidence for efficient trial design
Site selection and investigator	AI	Identifies suitable trial sites and investigators based on historical performance
Predictive analytics and adaptive trials	ML	Analyzes ongoing trial data for trends, enabling data-driven decisions and adjustments
Monitoring and risk-based quality management	AI, ML	Develops risk-based monitoring strategies prioritizing high-risk sites or areas
Data management and cleaning	NLP, ML	Processes unstructured data and identifies/corrects data inconsistencies
Real-time safety monitoring	AI	Monitors and analyzes adverse events in real-time for faster identification of safety concerns
Patient engagement and retention	AI, NLP	Develops personalized communication strategies using chatbots and virtual assistants
Automated clinical trial matching	AI, ML, NLP	Matches patients with suitable clinical trials based on medical history and eligibility

Clinical data management and AI/ML/GenAI

Data Management	Potential Impact	Example Technologies
Data Collection	Automated data capture methods improve the quality and speed of data collection.	Electronic Data Capture (EDC) Systems with AI algorithms for real-time data validation.
Data Integration	ML algorithms enable integration of various types of data (clinical, omics, imaging) into a unified dataset.	Data integration platforms with ML capabilities for omics and clinical data.
Data Validation	AI algorithms can identify and flag anomalies, missing data, and inconsistencies for rapid resolution.	AI-powered data validation tools for detecting outliers and inconsistencies.
Data Quality Control	Constant ML monitoring can ensure that data meets regulatory and company standards.	ML models that assess the data quality in real-time.
Safety Monitoring	Real-time AI algorithms can identify safety signals and adverse events quicker than traditional methods.	AI algorithms for Pharmacovigilance and safety signal detection.
Adaptive Trial Design	GenAI can model complex trial scenarios to adapt trial design in real-time.	Simulation software using GenAI for optimizing adaptive trial designs.
Patient Stratification	ML models can predict patient responses to interventions, improving the design and analysis of clinical trials.	Predictive analytics tools for selecting appropriate patient cohorts.
Endpoint Detection	AI can automate the analysis of complex trial endpoints such as imaging or biomarkers.	AI-based medical imaging analysis for endpoint evaluation.
Statistical Analysis	Advanced AI algorithms can perform complex statistical analyses more efficiently.	AI-powered statistical software for survival analysis, multi-factorial tests, etc.
Regulatory Submission	AI tools can automatically generate necessary documents and ensure compliance with regulatory standards.	AI-powered regulatory compliance and document generation tools.
Data Security	ML algorithms can monitor data access and flag unauthorized or suspicious activities.	AI/ML-based cybersecurity solutions for data protection.
Post-Market Surveillance	AI algorithms can continually monitor real-world data to evaluate long-term efficacy and safety.	Real-World Evidence platforms employing AI for post-market surveillance.

Gen AI can be used in two ways

Consume

- Generative AI and LLM applications are **easily accessible**
- Tailored to a small degree through **prompt tuning and prefix learning**

Customize

- Most companies will need to customize models by fine-tuning them with their **own data**
- Allows models to support more downstream tasks across the business and **unlock new performance frontiers**

Customizable Models

Case Studies

Using AI to support pre-clinical drug discovery

Lab | BioInnovation | Dublin
Predicting Gene-Disease Associations for Headache & Migraine Disorders
 Using AI to support pre-clinical drug discovery

Call for Change
 Identifying and prioritizing genes associated with a disease to develop new drug targets is not a trivial task. In the case of headache and migraine, the genetic architecture is complex and the genetic architecture is highly polygenic, with many genes of small effect size.

When Tech Meets Human Ingenuity
 We performed EDA on a diverse Accenture Health Research dataset, along with Accenture Clinical and Life Sciences Experts on the Biopredictive TCO, with input and feedback from the pharma partners. We leveraged our biological data and constructed a domain-specific knowledge graph, allowing us to infer new relationships between genes and diseases.

A Valuable Difference
 Our ML model correctly prioritized the known genes and identified new genes associated with headache and migraine. This gives confidence in the model to also prioritize predicted candidate gene-headache and migraine associations that we recommended to the pharma partners.

Using AI to predict rate of progression of Alzheimer's Disease in patients

Lab | BioInnovation | Dublin
Adopting AI for Neurodegenerative Diseases
 Using AI to support researchers and clinicians to predict rate of progression of Alzheimer's Disease in patients

Call for Change
 Alzheimer's disease is one of the top 10 leading causes of death in the United States and the 6th leading cause of death among US adults.

When Tech Meets Human Ingenuity
 Working hand in hand with DMRG neurosciences, Accenture leveraged its data and expertise to develop a predictive model to identify patients at risk of rapid progression of Alzheimer's disease.

A Valuable Difference
 Our AI model predicted decline in Alzheimer's disease patients, allowing researchers and clinicians to identify patients at risk of rapid progression of Alzheimer's disease.

Copyright © 2023 Accenture. All rights reserved. 18

Using AI to support precision medicine and improve patient outcomes

Lab | BioInnovation | Dublin
Identifying Covid-19 Genetic Risk Factors in DVT Patients
 Using AI to support precision medicine

Call for Change
 In summer 2020, there was an ever-growing corpus of published papers on the COVID-19 virus and its impact on patients.

When Tech Meets Human Ingenuity
 Accenture Data Science & Analytics was the core of our clinical expertise, alongside other biological data, and constructed a high-quality domain-specific knowledge graph, allowing us to infer new relationships between Covid-19 and DVT.

A Valuable Difference
 Our risk model found 6 predictions were present to be correct 80% of the time. This model was used to identify patients at risk of rapid progression of COVID-19.

Access a full view of a patient's health record

Lab | BioInnovation | Dublin
A Holistic Health Record for Neurodegenerative Diseases
 Enabling clients to access a full view of a patient's health record, combining data across clinical systems, claims, patient monitoring devices and more

Call for Change
 Alzheimer's disease is one of the top 10 leading causes of death in the United States and the 6th leading cause of death among US adults.

When Tech Meets Human Ingenuity
 Accenture was able to leverage AI and work with Enory to create interoperable data integrations by combining Enory's clinical data with other patient data.

A Valuable Difference
 In the past, Enory's CDISC research data that was hidden in isolated databases, had inaccessible systems difficult to exchange, analyze, or interpret.

Copyright © 2023 Accenture. All rights reserved. 23

Develop data-led clinical trial solutions

Lab | BioInnovation | Dublin
Re-envisioning Clinical Trials at a Global Pharmacy Retailer
 Enabling a retail pharmacy to develop data-led clinical trial solutions

Call for Change
 Recruitment as well as diversity in clinical trials are widespread issues for Life Sciences companies. Global pharmacy retailers can leverage their unique pharmacy data to enter the clinical trial space with experience and increase access and retention in sponsored drug development programs as well as help address diversity issues.

When Tech Meets Human Ingenuity
 Accenture leveraged AIHAI (Accenture Health Analytics) platform and worked with the pharmacy retailer to deliver a clinical trial data and analytics solution.

A Valuable Difference
 Our work has enabled a global pharmacy retailer's established pharmacy presence and nationwide footprint with enterprise-wide health solutions that can deliver meaningful real-world evidence and address otherwise hard to reach disease communities.

Copyright © 2023 Accenture. All rights reserved. 20

Using Real World Data & Analytics to identify Patients with Rare Diseases

Lab | BioInnovation | Dublin
Algorithms for Rare diseases at a Global Pharmaceutical Company
 Using Real World Data and Analytics to identify Patients with Rare Diseases

Call for Change
 Despite significant advances in medical research and diagnostic technology, identifying patients with rare diseases remains a significant challenge for healthcare professionals.

When Tech Meets Human Ingenuity
 Accenture leveraged AIHAI to test and refine existing algorithms for rare disease identification that had been developed by the company from literature.

A Valuable Difference
 By leveraging real world data, we were able to test and significantly improve the performance of the algorithms for identifying patients with rare diseases.

Copyright © 2023 Accenture. All rights reserved. 28

Leverage Real World Data to identify patient sub-populations for precision medicine

Lab | BioInnovation | Dublin
Patient Stratification Using Real-World Evidence at a Global Pharmaceutical Company
 Leveraging Real World Data to identify patient sub-populations for precision medicine

Call for Change
 Despite the efficacy in treating various autoimmune diseases, a significant portion of patients may not respond positively to the medication.

When Tech Meets Human Ingenuity
 Accenture was able to leverage AIHAI to identify patients who are likely to have a negative response to the biological drug treatment based on their clinical data and genetic variants, and biopharm.

A Valuable Difference
 Accenture was able to integrate biopharm and genomic data to identify the variant associated with the treatment response through specific biopharm.

Copyright © 2023 Accenture. All rights reserved. 27

Ability to link clinical and genomic data for discovery

Lab | BioInnovation | Dublin
Leveraging patient level omics and clinical data for discovery
 Demonstrating the power of linked clinical and genomic data for discovery

Call for Change
 A small Swiss community in Mexico has a unique genetic composition due to the high occurrence of intra-community marriages, which pose great potential for unique genomic-based discovery.

When Tech Meets Human Ingenuity
 The Whole Exome Sequenced genomes of the population were analyzed and linked to their corresponding EHR to create a unique whole-exome subset of paired clinical-genomic profiles and detailed medical records.

A Valuable Difference
 Our work enables us to validate hypotheses around functional effects of loss of function or other types of gene variants by demonstrating changes at the protein level.

A word of caution...

Without a robust security strategy, GenAI products pose a heightened risk of compromise. Building on your existing Ethical Guidelines, industry needs to consider model risk, plagiarism and copyright infringement.

Top Considerations Relevant to Life Sciences

Copyright Infringement and Plagiarism

In bringing together information from the internet, GenAI tools might use copyright protected content. We're already seeing plagiarism claims made and detection tools being developed.

Intellectual Property and Privacy

As tools continuously learn, data submissions are at risk of being used to generate content. Sensitive data could be used to train models. Italy temporarily banned ChatGPT on such privacy concerns.

Cybersecurity

While GenAI will improve tools that defend against cyber attacks, cyber attacks themselves will continue to become more sophisticated.

Inaccurate or Misleading Information

Whilst GenAI tools can delight with creative responses, these tools may produce inaccurate information or "fill in the blanks" which can produce misleading insights.

Human Bias

Since GenAI tools are trained on human-created data, there will be a risk that human bias can infiltrate the generated content.

Human trust

It is increasingly difficult to determine which outputs have been artificially generated, which translates to a need for a system that allows for positive human involvement.

The market is responding

There are new models, frameworks, and technologies available that help guide AI programs forward with trust, security, and privacy.

Emerging Startup Ecosystem

Emerging tech companies are working to secure AI

Companies formed in the last year have raised between \$5 - \$10M to develop security components of GenAI.

Hidden Layer, Robust Intelligence, Troj.AI, and CalypsoAI are racing to provide solutions.

Accenture tracks these projects to provide leverage to clients.

MITRE ATLAS™

Adversarial Threat Landscape for Artificial-Intelligence Systems

Research giant MITRE has produced a framework for evaluating the risks of current and future AI systems.

Accenture applies this framework to client projects to provide a holistic approach to securing GenAI uses.

Recognizing the importance of responsible AI, amplified by the unique risks posed by Gen AI

Workforce
Displacement

Unreliable

| <p>03 A risk intelligent selection strategy for foundation models</p> | <p>06 Human in the loop</p> | |

Responsible AI is critical in highly regulated industries like LS

Responsible AI is the practice of designing, building and deploying AI in accordance with clear principles to empower businesses, respect people, and benefit society — allowing companies to engender trust in AI and to scale AI with confidence

Getting to the right AI operating model

What are Generative AI implications?

WHAT WE ANTICIPATE

GenAI has the potential to impact the entire value chain. Parts of industry that have been less exposed to analytics will need to be engaged to maximise GenAI value

Innovation with AI will become more democratised. The pace of experimentation will be more rapid given the bar to using LLMs has been significantly lowered

industry's ecosystem landscape will evolve rapidly. industry's strategic partners will most likely develop diverse capabilities inspired by Co -Pilot and ChatGPT

The pace of GenAI innovation risks siloed solutions and adoptions. The wide range of tech and deployment options introduces the risks of disjointed solutions

Guardrails will need to evolve at pace. To ensure compliance across all industry functions on legal, Responsible/Ethical AI, sustainability, security matters

GenAI will create new roles and skills. New roles and practices will be needed to conduct activities such as prompt engineering

The impact on the current workforce is likely to be high. Though the impact of GenAI on the regular workforce are not yet fully understood, it should not be underestimated

KEY IMPLICATIONS FOR ENTERPRISE

Design an overarching GenAI strategy and approach to reduce risks of divergence from a fully federated approach

Refine/augment existing route to live methodologies for AI powered applications, balancing pace of innovation with robust release management

Streamline partnership strategy to build an overarching view of the GenAI ecosystem and strategic partner roadmaps and ensure a joined -up approach

Introduce LLM design & technical authority to oversee reference architecture and consistent model selection & application deployment patterns

Adopt pragmatic, cross -organisational guardrails for data privacy, legal, IP and responsible and ethical AI to keep pace with the latest innovations

Build centralised expertise in the short term in order to reach a critical mass of GenAI skills

Formulate a coordinated impact assessment and skilling strategy to enable workforce readiness in the future world of work
